General Vlasov Equation

Vlasov Equation

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f + \mathbf{F}_0 \cdot \nabla_\xi f = 0.$$

with force term $\mathbf{F}_0 = \mathbf{F}_0(t, x, \xi)$

General Vlasov Equation

Vlasov Equation

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f + \mathbf{F}_0 \cdot \nabla_\xi f = 0.$$

with force term $\mathbf{F}_0 = \mathbf{F}_0(t, x, \xi)$

- Describes the evolution of a distribution function of particles (for instance in plasma) in phase space

General Vlasov Equation

Vlasov Equation

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f + \mathbf{F}_0 \cdot \nabla_\xi f = 0.$$

with force term $\mathbf{F}_0 = \mathbf{F}_0(t, x, \xi)$

- Describes the evolution of a distribution function of particles (for instance in plasma) in phase space
- In general, a solution to this equation is a time-dependent (non-negative) measure: for all t , $f(t) \in \mathcal{M}(\mathbb{R}_x^d \times \mathbb{R}_\xi^d)$

General Vlasov Equation

Vlasov Equation

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f + \mathbf{F}_0 \cdot \nabla_\xi f = 0.$$

with force term $\mathbf{F}_0 = \mathbf{F}_0(t, x, \xi)$

- Describes the evolution of a distribution function of particles (for instance in plasma) in phase space
- In general, a solution to this equation is a time-dependent (non-negative) measure: for all t , $f(t) \in \mathcal{M}(\mathbb{R}_x^d \times \mathbb{R}_\xi^d)$
- If $\mathbf{F}_0 = -\nabla_x V$ where $V = V(t, x)$, we call V a potential.

General Vlasov Equation

Vlasov Equation

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f + \mathbf{F}_0 \cdot \nabla_\xi f = 0.$$

with force term $\mathbf{F}_0 = \mathbf{F}_0(t, x, \xi)$

- Describes the evolution of a distribution function of particles (for instance in plasma) in phase space
- In general, a solution to this equation is a time-dependent (non-negative) measure: for all t , $f(t) \in \mathcal{M}(\mathbb{R}_x^d \times \mathbb{R}_\xi^d)$
- If $\mathbf{F}_0 = -\nabla_x V$ where $V = V(t, x)$, we call V a potential.
- \mathbf{F}_0 (or V) may depend on f itself.

Logarithmic Vlasov Equation

Non-Linear Vlasov Equation with Logarithmic Non-Linearity

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f - \lambda \nabla_x (\ln \rho) \cdot \nabla_\xi f = 0, \quad (\text{logVla})$$

with $\lambda > 0$ and

$$\rho(t, x) = \int_{\mathbb{R}^d} f(t, x, d\xi).$$

Logarithmic Vlasov Equation

Non-Linear Vlasov Equation with Logarithmic Non-Linearity

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f - \lambda \nabla_x (\ln \rho) \cdot \nabla_\xi f = 0, \quad (\text{logVla})$$

with $\lambda > 0$ and

$$\rho(t, x) = \int_{\mathbb{R}^d} f(t, x, d\xi).$$

Remark

- Non-linear

Logarithmic Vlasov Equation

Non-Linear Vlasov Equation with Logarithmic Non-Linearity

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f - \lambda \nabla_x (\ln \rho) \cdot \nabla_\xi f = 0, \quad (\text{logVla})$$

with $\lambda > 0$ and

$$\rho(t, x) = \int_{\mathbb{R}^d} f(t, x, d\xi).$$

Remark

- Non-linear
- Highly singular

Logarithmic Vlasov Equation

Non-Linear Vlasov Equation with Logarithmic Non-Linearity

$$\frac{\partial f}{\partial t} + \xi \cdot \nabla_x f - \lambda \nabla_x (\ln \rho) \cdot \nabla_\xi f = 0, \quad (\text{logVla})$$

with $\lambda > 0$ and

$$\rho(t, x) = \int_{\mathbb{R}^d} f(t, x, d\xi).$$

Remark

- Non-linear
- **Highly singular**
- Formalization of the equation very difficult

Link with Euler and Schrödinger

Definition (Mono-Kinetic Measure)

A mono-kinetic measure is a measure of the form

$$f(t, dx, d\xi) = \rho(t, x) dx \otimes \delta_{\xi=v(t,x)},$$

with space distribution function ρ and speed v .

Link with Euler and Schrödinger

Definition (Mono-Kinetic Measure)

A mono-kinetic measure is a measure of the form

$$f(t, dx, d\xi) = \rho(t, x) dx \otimes \delta_{\xi=v(t,x)},$$

with space distribution function ρ and speed v .

Proposition

A mono-kinetic measure is solution to (logVla) iff (ρ, v) is solution of the Isothermal Euler System

$$\begin{cases} \partial_t \rho + \nabla_x \cdot (\rho v) = 0, \\ \partial_t (\rho v) + \nabla_x \cdot (\rho v \otimes v) + \lambda \nabla_x \rho = 0. \end{cases} \quad (\text{IES})$$

Link with Euler and Schrödinger

Wigner Transform

Definition (Wigner Transform [8, 7, 1, 6, 5])

For $u_\epsilon \in L^2(\mathbb{R}^d)$, the Wigner Transform W_ϵ is defined by

$$W_\epsilon(x, \xi) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot z} u_\epsilon \left(x + \frac{\epsilon z}{2} \right) \overline{u_\epsilon \left(x - \frac{\epsilon z}{2} \right)} dz. \quad (\text{WT})$$

Wigner Transform

Definition (Wigner Transform [8, 7, 1, 6, 5])

For $u_\epsilon \in L^2(\mathbb{R}^d)$, the Wigner Transform W_ϵ is defined by

$$W_\epsilon(x, \xi) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot z} u_\epsilon\left(x + \frac{\epsilon z}{2}\right) \overline{u_\epsilon\left(x - \frac{\epsilon z}{2}\right)} dz. \quad (\text{WT})$$

- Real-valued function on the phase space.

Wigner Transform

Definition (Wigner Transform [8, 7, 1, 6, 5])

For $u_\epsilon \in L^2(\mathbb{R}^d)$, the Wigner Transform W_ϵ is defined by

$$W_\epsilon(x, \xi) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot z} u_\epsilon \left(x + \frac{\epsilon z}{2} \right) \overline{u_\epsilon \left(x - \frac{\epsilon z}{2} \right)} dz. \quad (\text{WT})$$

- Real-valued function on the phase space.
- Not non-negative in general. However, it becomes non-negative when $\epsilon \rightarrow 0$:

Wigner Transform

Definition (Wigner Transform [8, 7, 1, 6, 5])

For $u_\epsilon \in L^2(\mathbb{R}^d)$, the Wigner Transform W_ϵ is defined by

$$W_\epsilon(x, \xi) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot z} u_\epsilon \left(x + \frac{\epsilon z}{2} \right) \overline{u_\epsilon \left(x - \frac{\epsilon z}{2} \right)} dz. \quad (\text{WT})$$

- Real-valued function on the phase space.
- Not non-negative in general. However, it becomes non-negative when $\epsilon \rightarrow 0$: if $(u_\epsilon)_{\epsilon > 0}$ is a bounded sequence in L^2 , then up to a subsequence $W_\epsilon \rightharpoonup W \in \mathcal{M}(\mathbb{R}^d \times \mathbb{R}^d)$ in \mathcal{S}' .

Wigner Transform

Definition (Wigner Transform [8, 7, 1, 6, 5])

For $u_\epsilon \in L^2(\mathbb{R}^d)$, the Wigner Transform W_ϵ is defined by

$$W_\epsilon(x, \xi) = \frac{1}{(2\pi)^d} \int_{\mathbb{R}^d} e^{-i\xi \cdot z} u_\epsilon \left(x + \frac{\epsilon z}{2} \right) \overline{u_\epsilon \left(x - \frac{\epsilon z}{2} \right)} dz. \quad (\text{WT})$$

- Real-valued function on the phase space.
- Not non-negative in general. However, it becomes non-negative when $\epsilon \rightarrow 0$: if $(u_\epsilon)_{\epsilon > 0}$ is a bounded sequence in L^2 , then up to a subsequence $W_\epsilon \rightharpoonup W \in \mathcal{M}(\mathbb{R}^d \times \mathbb{R}^d)$ in \mathcal{S}' .
- Reaches good results in order to perform the Semi-Classical Limit: if u_ϵ satisfies $i\epsilon \partial_t u_\epsilon + \frac{\epsilon^2}{2} \Delta u_\epsilon = V_0 u_\epsilon$ with V_0 satisfying suitable properties, then W verifies $\partial_t W + \xi \cdot \nabla_x W - \nabla_x V_0 \cdot \nabla_\xi W = 0$. Such a result also holds in some non-linear cases.

Solutions for the Logarithmic Schrödinger Equation

Theorem ([3, Theorem 1.5.])

Let $\lambda > 0$, $u_0 \in \mathcal{F}(H^1) \cap H^1(\mathbb{R}^d)$. Then there exists a unique, global solution $u \in L_{loc}^\infty(\mathbb{R}, \mathcal{F}(H^1) \cap H^1(\mathbb{R}^d))$ of

$$\begin{cases} i \partial_t u + \frac{\Delta u}{2} = \lambda u \ln |u|^2, \\ u(0, x) = u_0(x). \end{cases}$$

Moreover, $u \in C(\mathbb{R}, L^2 \cap H_w^1(\mathbb{R}^d))$.

Solutions for the Logarithmic Schrödinger Equation

Theorem ([3, Theorem 1.5.])

Let $\lambda > 0$, $u_0 \in \mathcal{F}(H^1) \cap H^1(\mathbb{R}^d)$. Then there exists a unique, global solution $u \in L_{loc}^\infty(\mathbb{R}, \mathcal{F}(H^1) \cap H^1(\mathbb{R}^d))$ of

$$\begin{cases} i \partial_t u + \frac{\Delta u}{2} = \lambda u \ln |u|^2, \\ u(0, x) = u_0(x). \end{cases}$$

Moreover, $u \in C(\mathbb{R}, L^2 \cap H_w^1(\mathbb{R}^d))$.

Remark

This result can easily be generalized to the general case $\epsilon > 0$.

Universal Dynamics

Theorem ([3, Theorem 1.7.])

For $u_0 \neq 0$, rescale the solution provided by the previous theorem to $v = v(t, y)$ by setting

$$u(t, x) = \frac{1}{\tau(t)^{\frac{d}{2}}} \frac{\|u_0\|_{L^2}}{\|\gamma\|_{L^2}} v\left(t, \frac{x}{\tau(t)}\right) e^{i \frac{\dot{\tau}(t)}{\tau(t)} \frac{|x|^2}{2}},$$

where $\ddot{\tau} = \frac{2\lambda}{\tau}$, $\tau(0) = 1$, $\dot{\tau}(0) = 0$, and $\gamma(x) = e^{-\frac{|x|^2}{2}}$. Then

$$\int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \\ |y|^2 \end{pmatrix} |v(t, y)|^2 dy \xrightarrow{t \rightarrow \infty} \int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \\ |y|^2 \end{pmatrix} \gamma^2(y) dy,$$

$$|v(t, \cdot)|^2 \xrightarrow{t \rightarrow \infty} \gamma^2 \quad \text{weakly in } L^1(\mathbb{R}^d).$$

Universal Dynamics

Theorem ([3, Theorem 1.7.])

For $u_0 \neq 0$, rescale the solution provided by the previous theorem to $v = v(t, y)$ by setting

$$u(t, x) = \frac{1}{\tau(t)^{\frac{d}{2}}} \frac{\|u_0\|_{L^2}}{\|\gamma\|_{L^2}} v\left(t, \frac{x}{\tau(t)}\right) e^{i \frac{\dot{\tau}(t)}{\tau(t)} \frac{|x|^2}{2}},$$

where $\ddot{\tau} = \frac{2\lambda}{\tau}$, $\tau(0) = 1$, $\dot{\tau}(0) = 0$, and $\gamma(x) = e^{-\frac{|x|^2}{2}}$. Then

$$\int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \\ |y|^2 \end{pmatrix} |v(t, y)|^2 dy \xrightarrow{t \rightarrow \infty} \int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \\ |y|^2 \end{pmatrix} \gamma^2(y) dy,$$

$$|v(t, \cdot)|^2 \xrightarrow{t \rightarrow \infty} \gamma^2 \quad \text{weakly in } L^1(\mathbb{R}^d).$$

Remark

$\tau(t) \underset{t \rightarrow \infty}{\sim} 2t\sqrt{\lambda \ln t}$: difference compared to the classical dispersion.

Wigner Measure

Three questions:

- Does the Wigner Transform of u_ϵ solution to $(\log\text{NLS}_\epsilon)$ **converge** ?
- Is this limit a **solution** to the Logarithmic Vlasov Equation ?
- Does it have the same **universal dynamics** as previously said ?

Wigner Measure

Three questions:

- Does the Wigner Transform of u_ϵ solution to $(\log\text{NLS}_\epsilon)$ **converge** ?
- Is this limit a **solution** to the Logarithmic Vlasov Equation ?
- Does it have the same **universal dynamics** as previously said ?

The article of R. Carles and A. Nouri ([4]) goes along those intuitions in two cases:

- Far from the vacuum: positive answer to the first two questions.

Wigner Measure

Three questions:

- Does the Wigner Transform of u_ϵ solution to $(\log\text{NLS}_\epsilon)$ **converge** ?
- Is this limit a **solution** to the Logarithmic Vlasov Equation ?
- Does it have the same **universal dynamics** as previously said ?

The article of R. Carles and A. Nouri ([4]) goes along those intuitions in two cases:

- Far from the vacuum: positive answer to the first two questions.
- A class of explicit solutions for $d = 1$: **the Gaussian case**.
 - Explicit solutions to $(\log\text{NLS}_\epsilon)$.
 - Limit of the Wigner Transform : explicit mono-kinetic solution to $(\log\text{Vla})$.
 - Similar dispersion
 - Up to a rescaling, strong convergence of $\rho(t, x) = \int_{\mathbb{R}} W(t, x, d\xi)$ to $\gamma^2 = e^{-|x|^2}$ in $L^1(\mathbb{R})$.

Logarithmic Vlasov Equation

Two questions:

- Do any "solutions" to $(\log V|a)$ formally have the same **universal dynamics** ?
- What are the **assumptions** (the minimal properties) we need to make the result rigorous ?

Logarithmic Vlasov Equation

Two questions:

- Do any "solutions" to $(\log V|a)$ formally have the same **universal dynamics** ?
- What are the **assumptions** (the minimal properties) we need to make the result rigorous ?

For the first question, we have two interesting cases:

- The previous Gaussian case. In the context of the Vlasov Equation, we call it the "Gaussian-monokinetic" case.
- A generalization of this case: **the mono-kinetic case**. This has been done by R. Carles, K. Carrapatoso and M. Hillairet in [2].

where we recall $\gamma(x) = e^{-\frac{|x|^2}{2}}$.

- W_ϵ (resp. \tilde{W}_ϵ) the Wigner Transform of u_ϵ (resp. v_ϵ).

First properties

Proposition

Under the assumptions (H1) and notations (N1), there exists $\tilde{W} \in L^\infty((0, \infty), \mathcal{M}(\mathbb{R}^d \times \mathbb{R}^d))$ such that, up to a subsequence,

$$\tilde{W}_\epsilon \xrightarrow{\epsilon \rightarrow 0} \tilde{W} \quad \text{in } L^1_{loc}((0, \infty), \mathcal{S}'_{w-*}(\mathbb{R}^d \times \mathbb{R}^d))$$

First properties

Proposition

Under the assumptions (H1) and notations (N1), there exists $\tilde{W} \in L^\infty((0, \infty), \mathcal{M}(\mathbb{R}^d \times \mathbb{R}^d))$ such that, up to a subsequence,

$$\tilde{W}_\epsilon \xrightarrow{\epsilon \rightarrow 0} \tilde{W} \quad \text{in } L^1_{loc}((0, \infty), \mathcal{S}'_{w-*}(\mathbb{R}^d \times \mathbb{R}^d))$$

Theorem (Integrability and regularity properties)

Under the assumptions (H1) and notations (N1), there holds for \tilde{W} :

$$\begin{aligned} \iint_{\mathbb{R}^d \times \mathbb{R}^d} \tilde{W}(t, dy, d\eta) &= \|\gamma^2\|_{L^1} \quad \text{for a.e. } t \geq 0, \\ \tilde{\rho}(t, y) &:= \int_{\mathbb{R}^d} \tilde{W}(t, y, d\eta) \in \mathcal{C}(\mathbb{R}^+, W^{-1,1} \cap L^1_w(\mathbb{R}^d)), \\ \int_{\mathbb{R}^d} \tilde{\rho}(t, y) (|y|^2 + |\ln \tilde{\rho}(t, y)|) dy &\leq C. \end{aligned}$$

Main Theorem

Theorem (Universal Dynamics for a Wigner Measure of (logNLS_ε))

Under the assumptions (H1) and notations (N1), there holds for the limit \tilde{W} of \tilde{W}_ϵ and $\tilde{\rho} = \int_{\mathbb{R}^d} \tilde{W}(t, y, d\eta)$, with $\gamma(x) = e^{-\frac{|x|^2}{2}}$:

$$\int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \end{pmatrix} \tilde{\rho}(t, y) dy \xrightarrow{t \rightarrow \infty} \int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \end{pmatrix} \gamma^2(y) dy,$$

and

$$\tilde{\rho}(t, \cdot) \xrightarrow{t \rightarrow \infty} \gamma^2 \quad \text{weakly in } L^1(\mathbb{R}^d).$$

Main Theorem

Theorem (Universal Dynamics for a Wigner Measure of $(\log\text{NLS}_\epsilon)$)

Under the assumptions (H1) and notations (N1), there holds for the limit \tilde{W} of \tilde{W}_ϵ and $\tilde{\rho} = \int_{\mathbb{R}^d} \tilde{W}(t, y, d\eta)$, with $\gamma(x) = e^{-\frac{|x|^2}{2}}$:

$$\int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \end{pmatrix} \tilde{\rho}(t, y) dy \xrightarrow{t \rightarrow \infty} \int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \end{pmatrix} \gamma^2(y) dy,$$

and

$$\tilde{\rho}(t, \cdot) \xrightarrow{t \rightarrow \infty} \gamma^2 \quad \text{weakly in } L^1(\mathbb{R}^d).$$

Remarks

- We still have the same dispersion rate in $(t\sqrt{\ln t})^{\frac{d}{2}}$.
- The lack of bounds of a higher moment in our proof does not allow us to reach the convergence of the quadratic momentum.

$$\dot{\mathcal{E}}^\epsilon = -2 \frac{\dot{\tau}(t)}{\tau(t)} \mathcal{E}_{\text{kin}}^\epsilon.$$

Lemma

Under the assumptions (H1) and notations (N1), there holds

$$\iint_{\mathbb{R}^d \times \mathbb{R}^d} \tilde{W}(t, dy, d\eta) = \|\gamma^2\|_{L^1} \quad \text{for a.e. } t \geq 0,$$

$$\tilde{\rho}(t, y) := \int_{\mathbb{R}^d} \tilde{W}(t, y, d\eta) \in \mathcal{C}(\mathbb{R}^+, W^{-1,1} \cap L_w^1(\mathbb{R}^d)),$$

$$\int_{\mathbb{R}^d} \tilde{\rho}(t, y) (|y|^2 + |\ln \tilde{\rho}(t, y)|) dy \leq C.$$

End of the proof

$$\rho_\epsilon = |v_\epsilon|^2, \quad J_\epsilon = \text{Im}(\epsilon \bar{v}_\epsilon \nabla v_\epsilon).$$

End of the proof

$$\rho_\epsilon = |v_\epsilon|^2, \quad J_\epsilon = \text{Im}(\epsilon \bar{v}_\epsilon \nabla v_\epsilon).$$

- We compute:

$$\partial_t \rho_\epsilon + \frac{1}{\tau^2(t)} \nabla \cdot J_\epsilon = 0,$$

$$\partial_t J_\epsilon + \lambda \nabla \rho_\epsilon + 2\lambda y \rho_\epsilon = \frac{\epsilon^2}{4\tau^2(t)} \Delta \nabla \rho - \frac{\epsilon^2}{\tau^2(t)} \nabla \cdot (\text{Re}(\nabla v_\epsilon \otimes \overline{\nabla v_\epsilon})).$$

End of the proof

$$\rho_\epsilon = |v_\epsilon|^2, \quad J_\epsilon = \text{Im}(\epsilon \bar{v}_\epsilon \nabla v_\epsilon).$$

- We compute:

$$\partial_t \rho_\epsilon + \frac{1}{\tau^2(t)} \nabla \cdot J_\epsilon = 0,$$

$$\partial_t J_\epsilon + \lambda \nabla \rho_\epsilon + 2\lambda y \rho_\epsilon = \frac{\epsilon^2}{4\tau^2(t)} \Delta \nabla \rho - \frac{\epsilon^2}{\tau^2(t)} \nabla \cdot (\text{Re}(\nabla v_\epsilon \otimes \overline{\nabla v_\epsilon})).$$

- Passing the two previous equations to the limit $\epsilon \rightarrow 0$:

$$\partial_t \rho + \frac{1}{\tau^2(t)} \nabla \cdot J = 0,$$

$$\partial_t J + \lambda \nabla \rho + 2\lambda y \rho = -\nabla \cdot \nu.$$

End of the proof

$$\rho_\epsilon = |v_\epsilon|^2, \quad J_\epsilon = \text{Im}(\epsilon \bar{v}_\epsilon \nabla v_\epsilon).$$

- We compute:

$$\partial_t \rho_\epsilon + \frac{1}{\tau^2(t)} \nabla \cdot J_\epsilon = 0,$$

$$\partial_t J_\epsilon + \lambda \nabla \rho_\epsilon + 2\lambda y \rho_\epsilon = \frac{\epsilon^2}{4\tau^2(t)} \Delta \nabla \rho - \frac{\epsilon^2}{\tau^2(t)} \nabla \cdot (\text{Re}(\nabla v_\epsilon \otimes \overline{\nabla v_\epsilon})).$$

- Passing the two previous equations to the limit $\epsilon \rightarrow 0$:

$$\partial_t \rho + \frac{1}{\tau^2(t)} \nabla \cdot J = 0,$$

$$\partial_t J + \lambda \nabla \rho + 2\lambda y \rho = -\nabla \cdot \nu.$$

- Change of time variable: $s = \frac{1}{2} \ln \tau(t)$.

End of the proof

$$\rho_\epsilon = |v_\epsilon|^2, \quad J_\epsilon = \text{Im}(\epsilon \bar{v}_\epsilon \nabla v_\epsilon).$$

- We compute:

$$\partial_t \rho_\epsilon + \frac{1}{\tau^2(t)} \nabla \cdot J_\epsilon = 0,$$

$$\partial_t J_\epsilon + \lambda \nabla \rho_\epsilon + 2\lambda y \rho_\epsilon = \frac{\epsilon^2}{4\tau^2(t)} \Delta \nabla \rho - \frac{\epsilon^2}{\tau^2(t)} \nabla \cdot (\text{Re}(\nabla v_\epsilon \otimes \overline{\nabla v_\epsilon})).$$

- Passing the two previous equations to the limit $\epsilon \rightarrow 0$:

$$\partial_t \rho + \frac{1}{\tau^2(t)} \nabla \cdot J = 0,$$

$$\partial_t J + \lambda \nabla \rho + 2\lambda y \rho = -\nabla \cdot \nu.$$

- Change of time variable: $s = \frac{1}{2} \ln \tau(t)$.
- Unique weak limit $\tilde{\rho}_\infty = \gamma^2(y)$ of $\tilde{\rho}(s + \cdot, \cdot)$ when $s \rightarrow \infty$. □

Outline

- 1 Introduction
- 2 Motivations
- 3 Universal Dynamics for the Wigner Measure
- 4 Universal Dynamics for the Logarithmic Vlasov Equation**
 - A class of explicit solutions: the Gaussian-Gaussian case
 - Main result in the general case

Gaussian-Gaussian Solutions

Proposition (Gaussian-Gaussian solutions)

Solutions to $(\log V I_a)$ of the form

$$f(t, x, \xi) = \frac{1}{\pi c_1(t) c_2(t)} \exp \left[-\frac{|x - b_1(t)|^2}{c_1(t)^2} - \frac{|\xi - b_2(t, x)|^2}{c_2(t)^2} \right]$$

can be computed explicitly. Moreover, the functions c_i and b_i ($i = 1, 2$) are uniquely defined once the initial data (which can be reduced to 5 parameters) have been provided.

Gaussian-Gaussian Solutions

Proposition (Gaussian-Gaussian solutions)

Solutions to (logVla) of the form

$$f(t, x, \xi) = \frac{1}{\pi c_1(t) c_2(t)} \exp \left[-\frac{|x - b_1(t)|^2}{c_1(t)^2} - \frac{|\xi - b_2(t, x)|^2}{c_2(t)^2} \right]$$

can be computed explicitly. Moreover, the functions c_i and b_i ($i = 1, 2$) are uniquely defined once the initial data (which can be reduced to 5 parameters) have been provided.

Remark

- $c_1(t) \underset{t \rightarrow \infty}{\sim} 2t\sqrt{\lambda \ln t} \underset{t \rightarrow \infty}{\sim} \tau(t)$.
- Strong convergence to γ^2 in L^1 after rescaling.
- Other "generalization" of the Gaussian-monokinetic case.

Outline

- 1 Introduction
- 2 Motivations
- 3 Universal Dynamics for the Wigner Measure
- 4 Universal Dynamics for the Logarithmic Vlasov Equation**
 - A class of explicit solutions: the Gaussian-Gaussian case
 - Main result in the general case

Assumptions

- Mass conservation :

$$\frac{d}{dt} \left(\iint_{\mathbb{R}^d \times \mathbb{R}^d} f(t, dx, d\xi) \right) = 0, \quad (\text{H2})$$

- Energy conservation :

$$\frac{d}{dt} \left(\frac{1}{2} \iint_{\mathbb{R}^d \times \mathbb{R}^d} |\xi|^2 f(t, dx, d\xi) + \lambda \int_{\mathbb{R}^d} \rho(t, x) \ln \rho(t, x) dx \right) = 0, \quad (\text{H3})$$

- Equations on ρ and J :

$$\partial_t \rho(t, x) + \nabla_x \cdot \left(\int_{\mathbb{R}^d} \xi f(t, x, d\xi) \right) = 0, \quad (\text{H4})$$

$$\partial_t \int_{\mathbb{R}^d} \xi f(t, x, d\xi) + \nabla_x \cdot \int_{\mathbb{R}^d} \xi \otimes \xi f(t, x, d\xi) + \lambda \nabla_x \rho(t, x) = 0, \quad (\text{H5})$$

Main result

Theorem (Universal Dynamics for the Logarithmic Vlasov Equation)

Assume that $f = f(t, x, \xi) \in L_{loc}^\infty((0, \infty); \mathcal{M}_{\Sigma_{\log}} \cap \mathcal{M}_2 \setminus \{0\})$ satisfies (H2)-(H5). Rescale:

$$f(t, x, \xi) = \frac{M}{\|\gamma^2\|_{L^1}} \tilde{f} \left(t, \frac{x}{\tau(t)}, \tau(t)\xi - \dot{\tau}(t)x \right),$$

where M is the total mass. Then

$$\tilde{\rho} \in L^\infty((0, \infty), L^1_2 \cap L \log L(\mathbb{R}^d)) \cap \mathcal{C}(\mathbb{R}^+, L^1_w(\mathbb{R}^d)),$$

$$\int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \\ |y|^2 \end{pmatrix} \tilde{\rho}(t, y) dy \xrightarrow{t \rightarrow \infty} \int_{\mathbb{R}^d} \begin{pmatrix} 1 \\ y \\ |y|^2 \end{pmatrix} \gamma^2(y) dy,$$

$$\tilde{\rho}(t, \cdot) \xrightarrow{t \rightarrow \infty} \gamma^2 \quad \text{weakly in } L^1(\mathbb{R}^d).$$

Summary

- The **Wigner Transform** of the solutions of $(\log\text{NLS}_\epsilon)$ converges and the dynamics of the limit is **universal**, similar to the universal dynamics found for $(\log\text{NLS}_\epsilon)$, with a weak convergence to γ^2 in L^1 .
- **Universal dynamics** are proven in the same way for the Logarithmic Vlasov Equation by assuming some formal properties, completed by a new class of **explicit Gaussian solutions** whose convergence is strong.

Summary

- The **Wigner Transform** of the solutions of $(\log\text{NLS}_\epsilon)$ converges and the dynamics of the limit is **universal**, similar to the universal dynamics found for $(\log\text{NLS}_\epsilon)$, with a weak convergence to γ^2 in L^1 .
- **Universal dynamics** are proven in the same way for the Logarithmic Vlasov Equation by assuming some formal properties, completed by a new class of **explicit Gaussian solutions** whose convergence is strong.

Perspectives:

- Convergence to γ^2 : uniform in ϵ ? In Wasserstein distance ?
- Analytic initial data: mono-kinetic Wigner Measure for small time ?
- The link between Wigner Measure and Vlasov equation still needs to be proven rigorously.
